A: So with your model you would do the following: Create a new flight simulation project (or select the default project in the launch menu) Create a new aircraft (choose FSX or FS9 if you don't have FSX in the package) In the aircraft, go to the sub-menu for Aircraft and pick "Aircraft" (just type aircraft, no sub-menu) Select your aircraft type Once in the Aircraft, you will be able to select a company via the "Select Company" function (when Aircraft_Defensive_Systems aircraft_company_selectable is set to TRUE) In the aircraft, go to the sub-menu for Aerodynamics and pick "Aerodynamics" (just type aerodynamics, no sub-menu) Select "Aileron System" In the aircraft, go to the sub-menu for Control and pick "Control" (just type control, no sub-menu) Select "Aileron System" In the aircraft, go to the sub-menu for Flight Model and pick "Flight Model" (just type flight model, no sub-menu) Select "DHC8-900" In the aircraft, go to the sub-menu for Special Options and pick "Vehicle Drive Force Feedback" (just type vehicle, no sub-menu) Select "Yes" And that is it. It should be something like that. The process should be similar for whatever aircraft you have. I used a Q400 (though it was an older model). Q: how do I enable :layout in drush ctools? I want to enable using :layout in my drupal ctools configuration for a specific block: I found this but I don't know what to do in the \$context object A: The menu layouts module (ctools) is just a wrapper around context and its one of those cases where the more complex the solution the more likely the less optimal option is the best (IMO). It's also nice to see no mention of Drush Make that is often forgotten... well I was when I first started. There's a module available to enable all these options within the context though (provided you are using Drupal 6), the only problem with this is that it
